

AN HARMONOGRAPH

IS A MACHINE MADE OF
2 OR MORE PENDULUMS,
ARMS AND A DRAWING

IT PRODUCES NICE
CYCLOID-LIKE DRAWINGS.

ANALOGIC: 3-PENDULUM MECHANISM

EDUCATIONAL APP/GAME

2-mode application:

I. set the mechanism
and draw

II. look at the drawing
& retweak the mechanism

But can we design a Python version?
Let's do it!

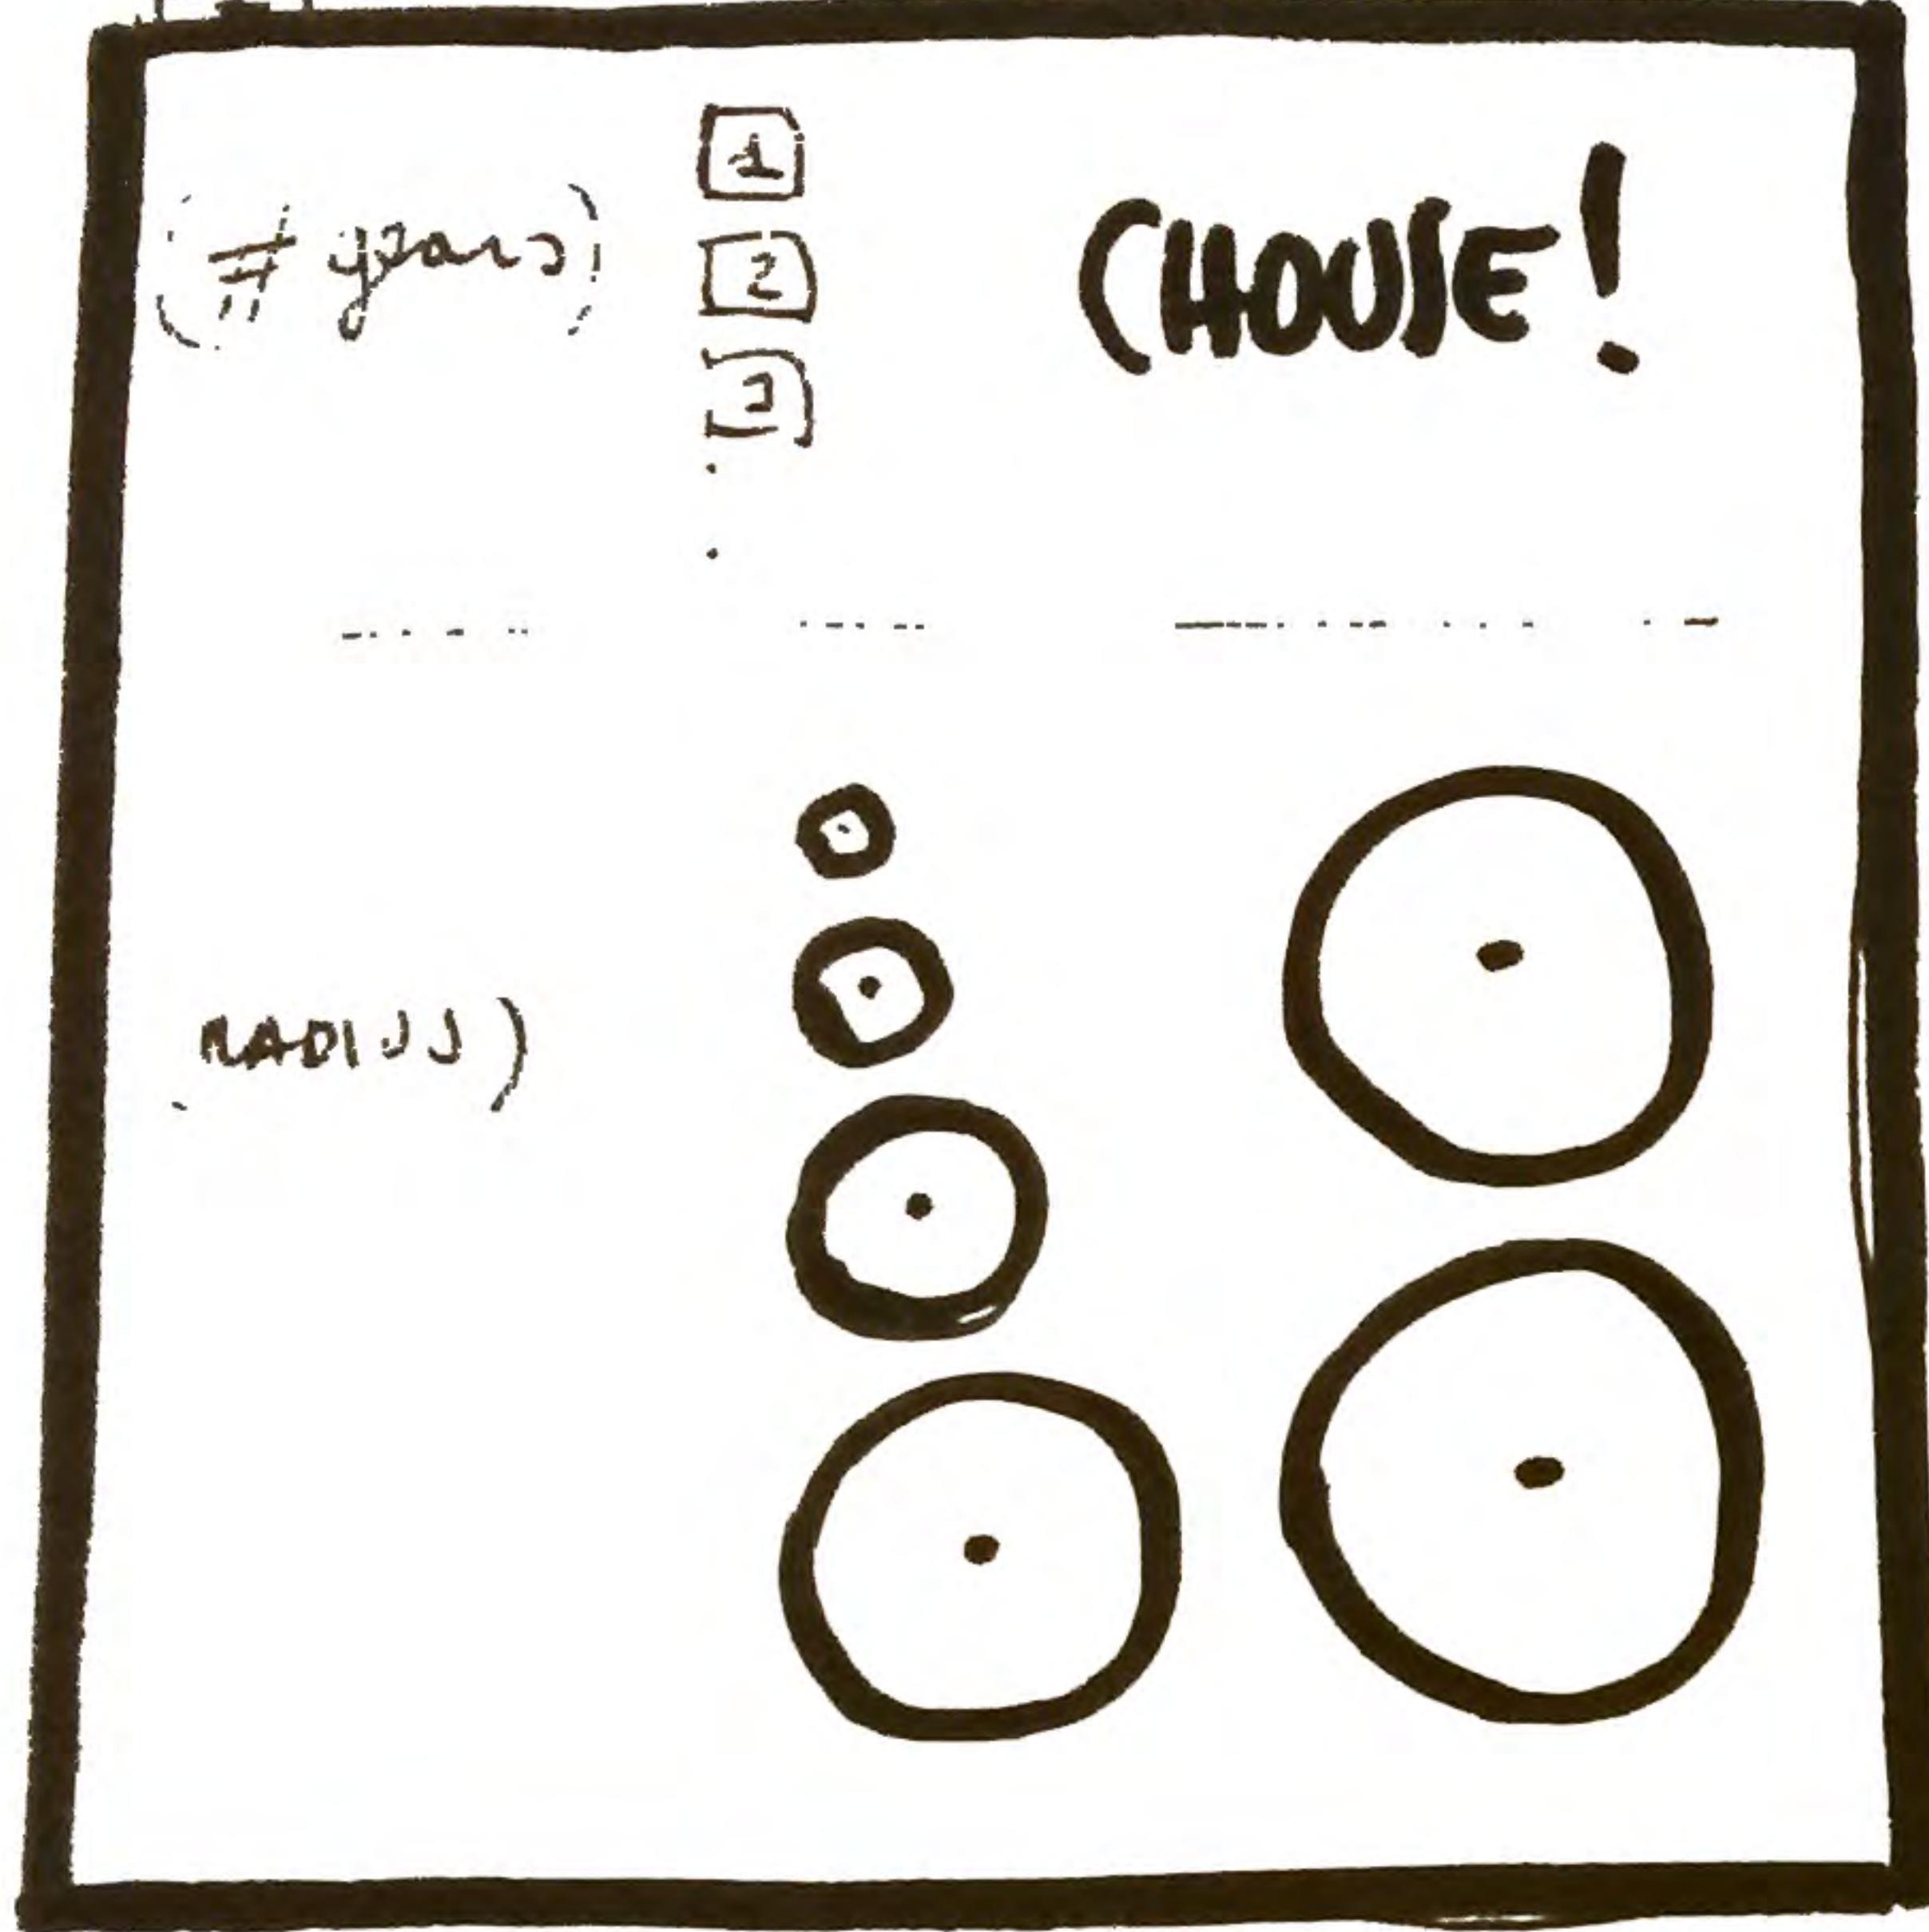

GOAL: design a TKinter Harmonograph on Python
to teach kids the beauty of pendulums,
cycloids and trigonometry

DIGITAL: PYTHON TKINTER

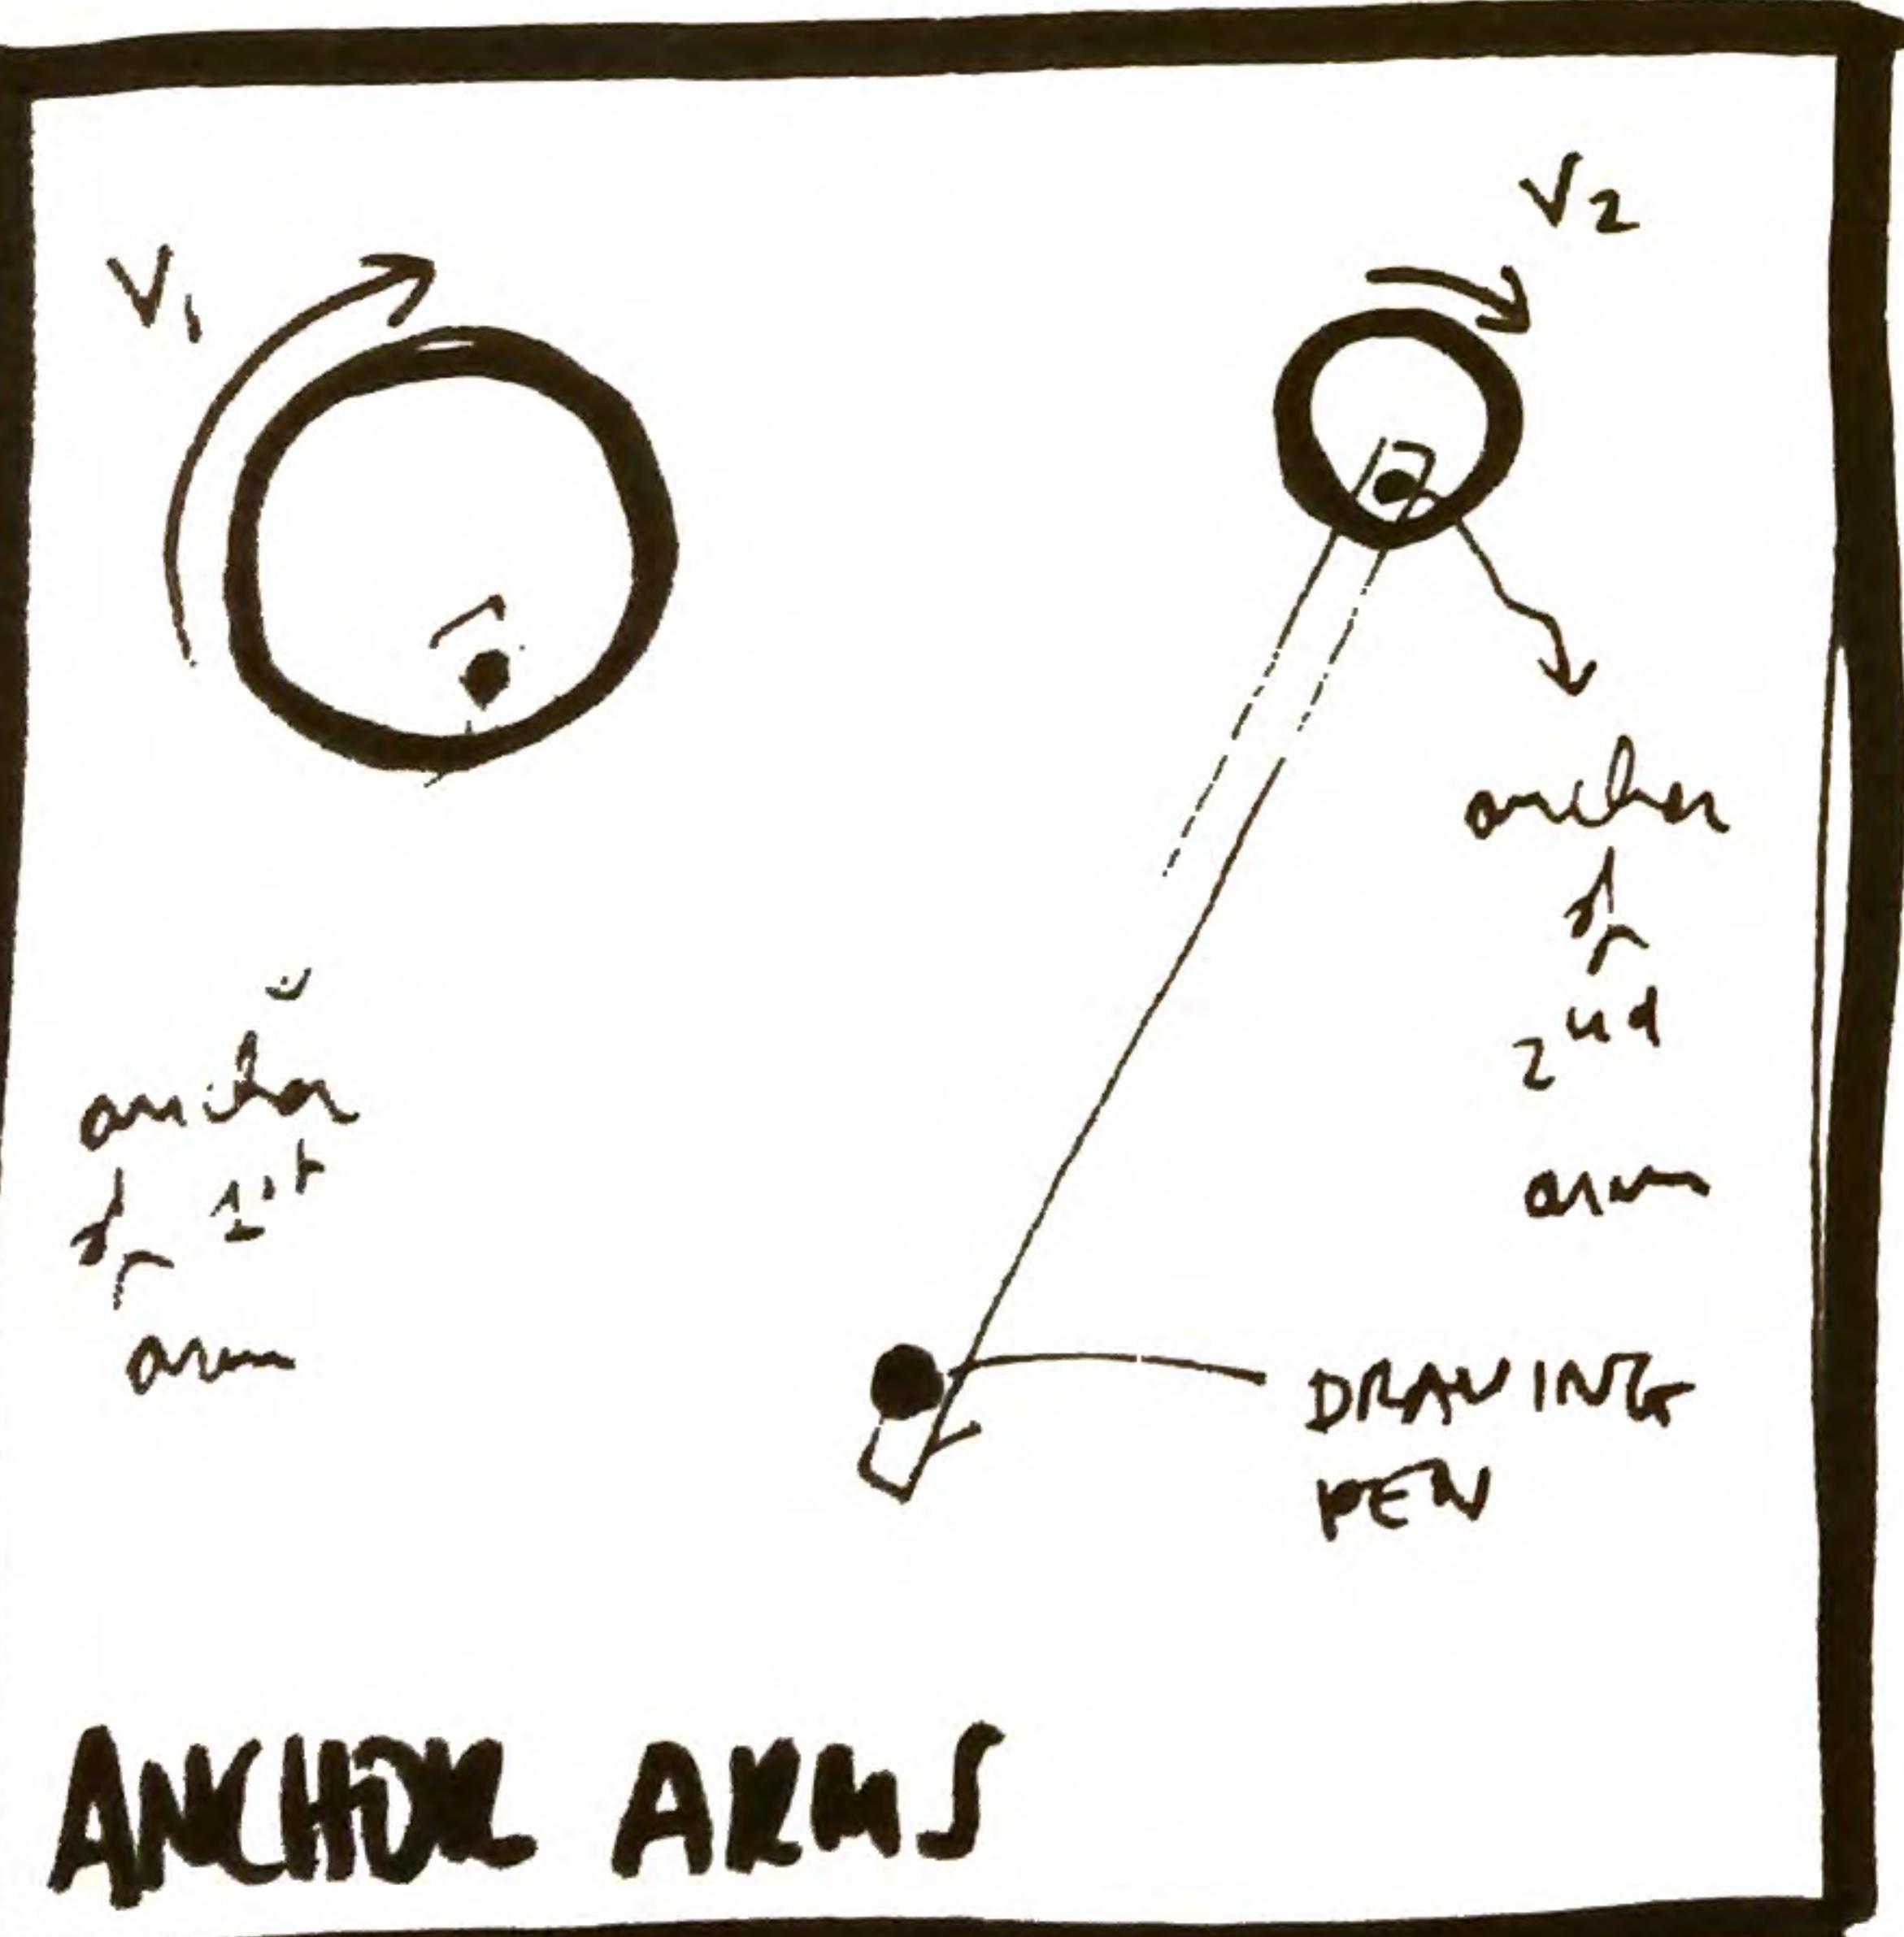

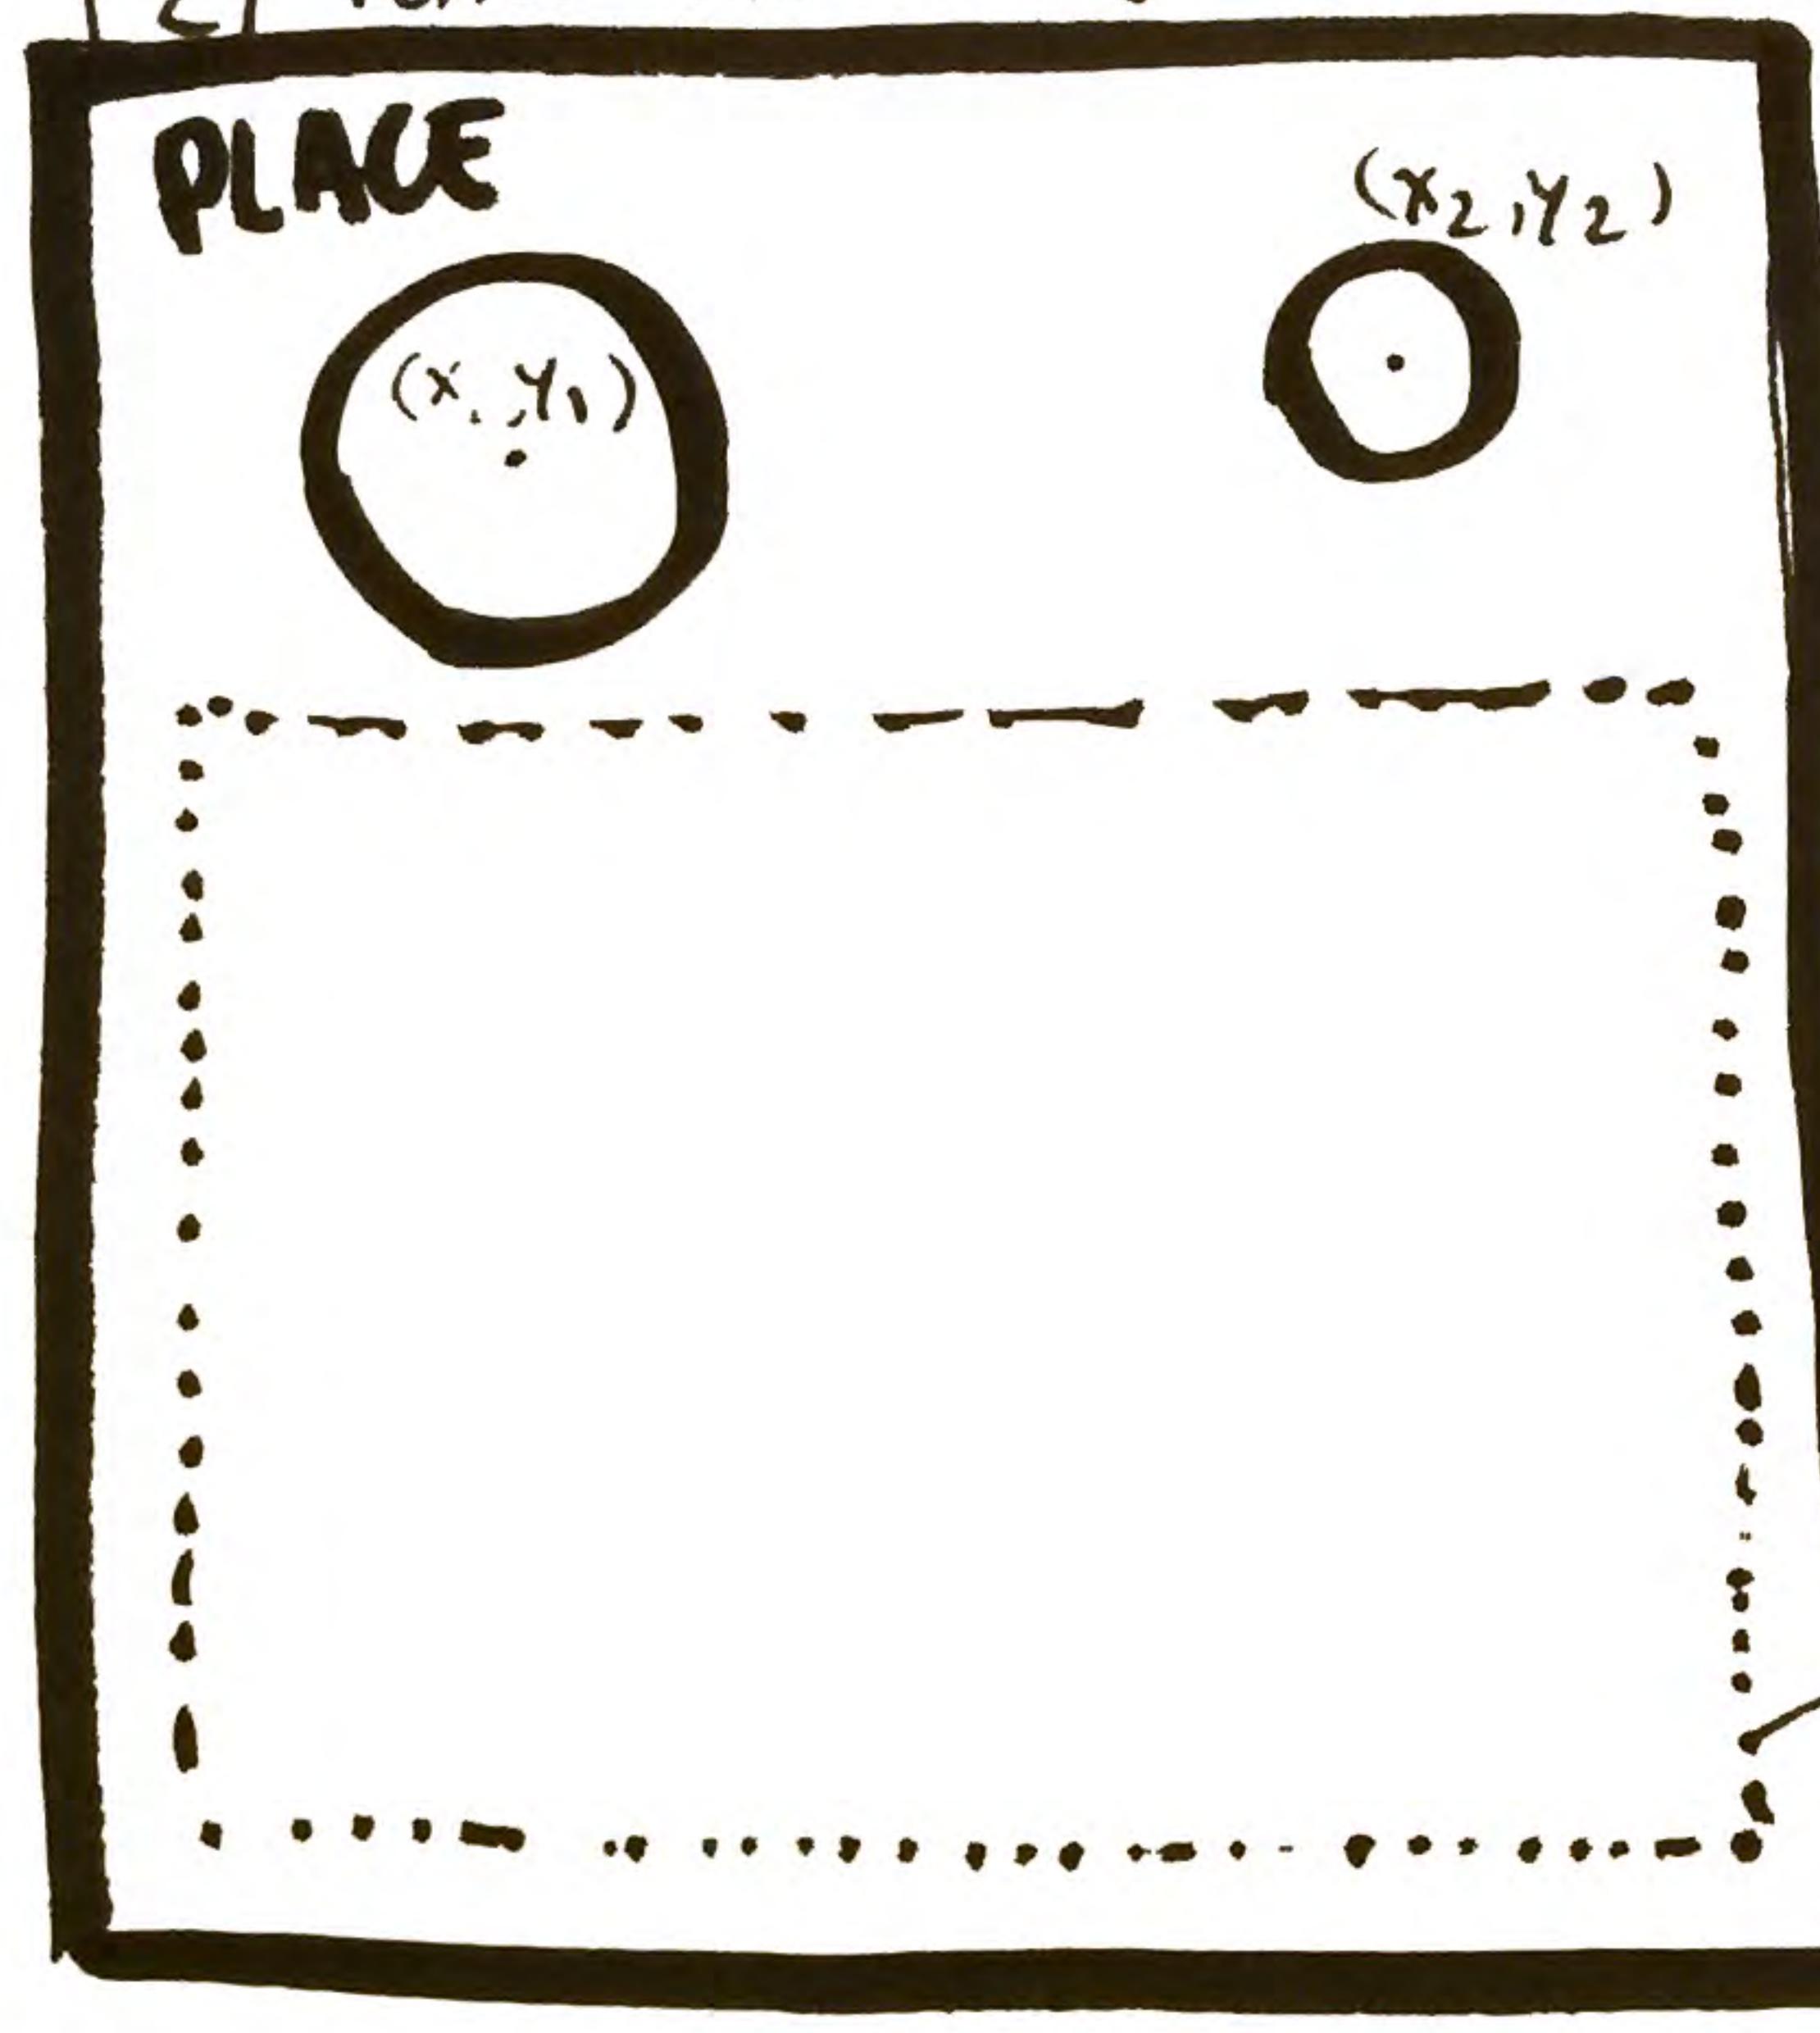

MODE I

JET THE MECHANISM, SEE THE RESULT

[1] SELECT THE GEARS

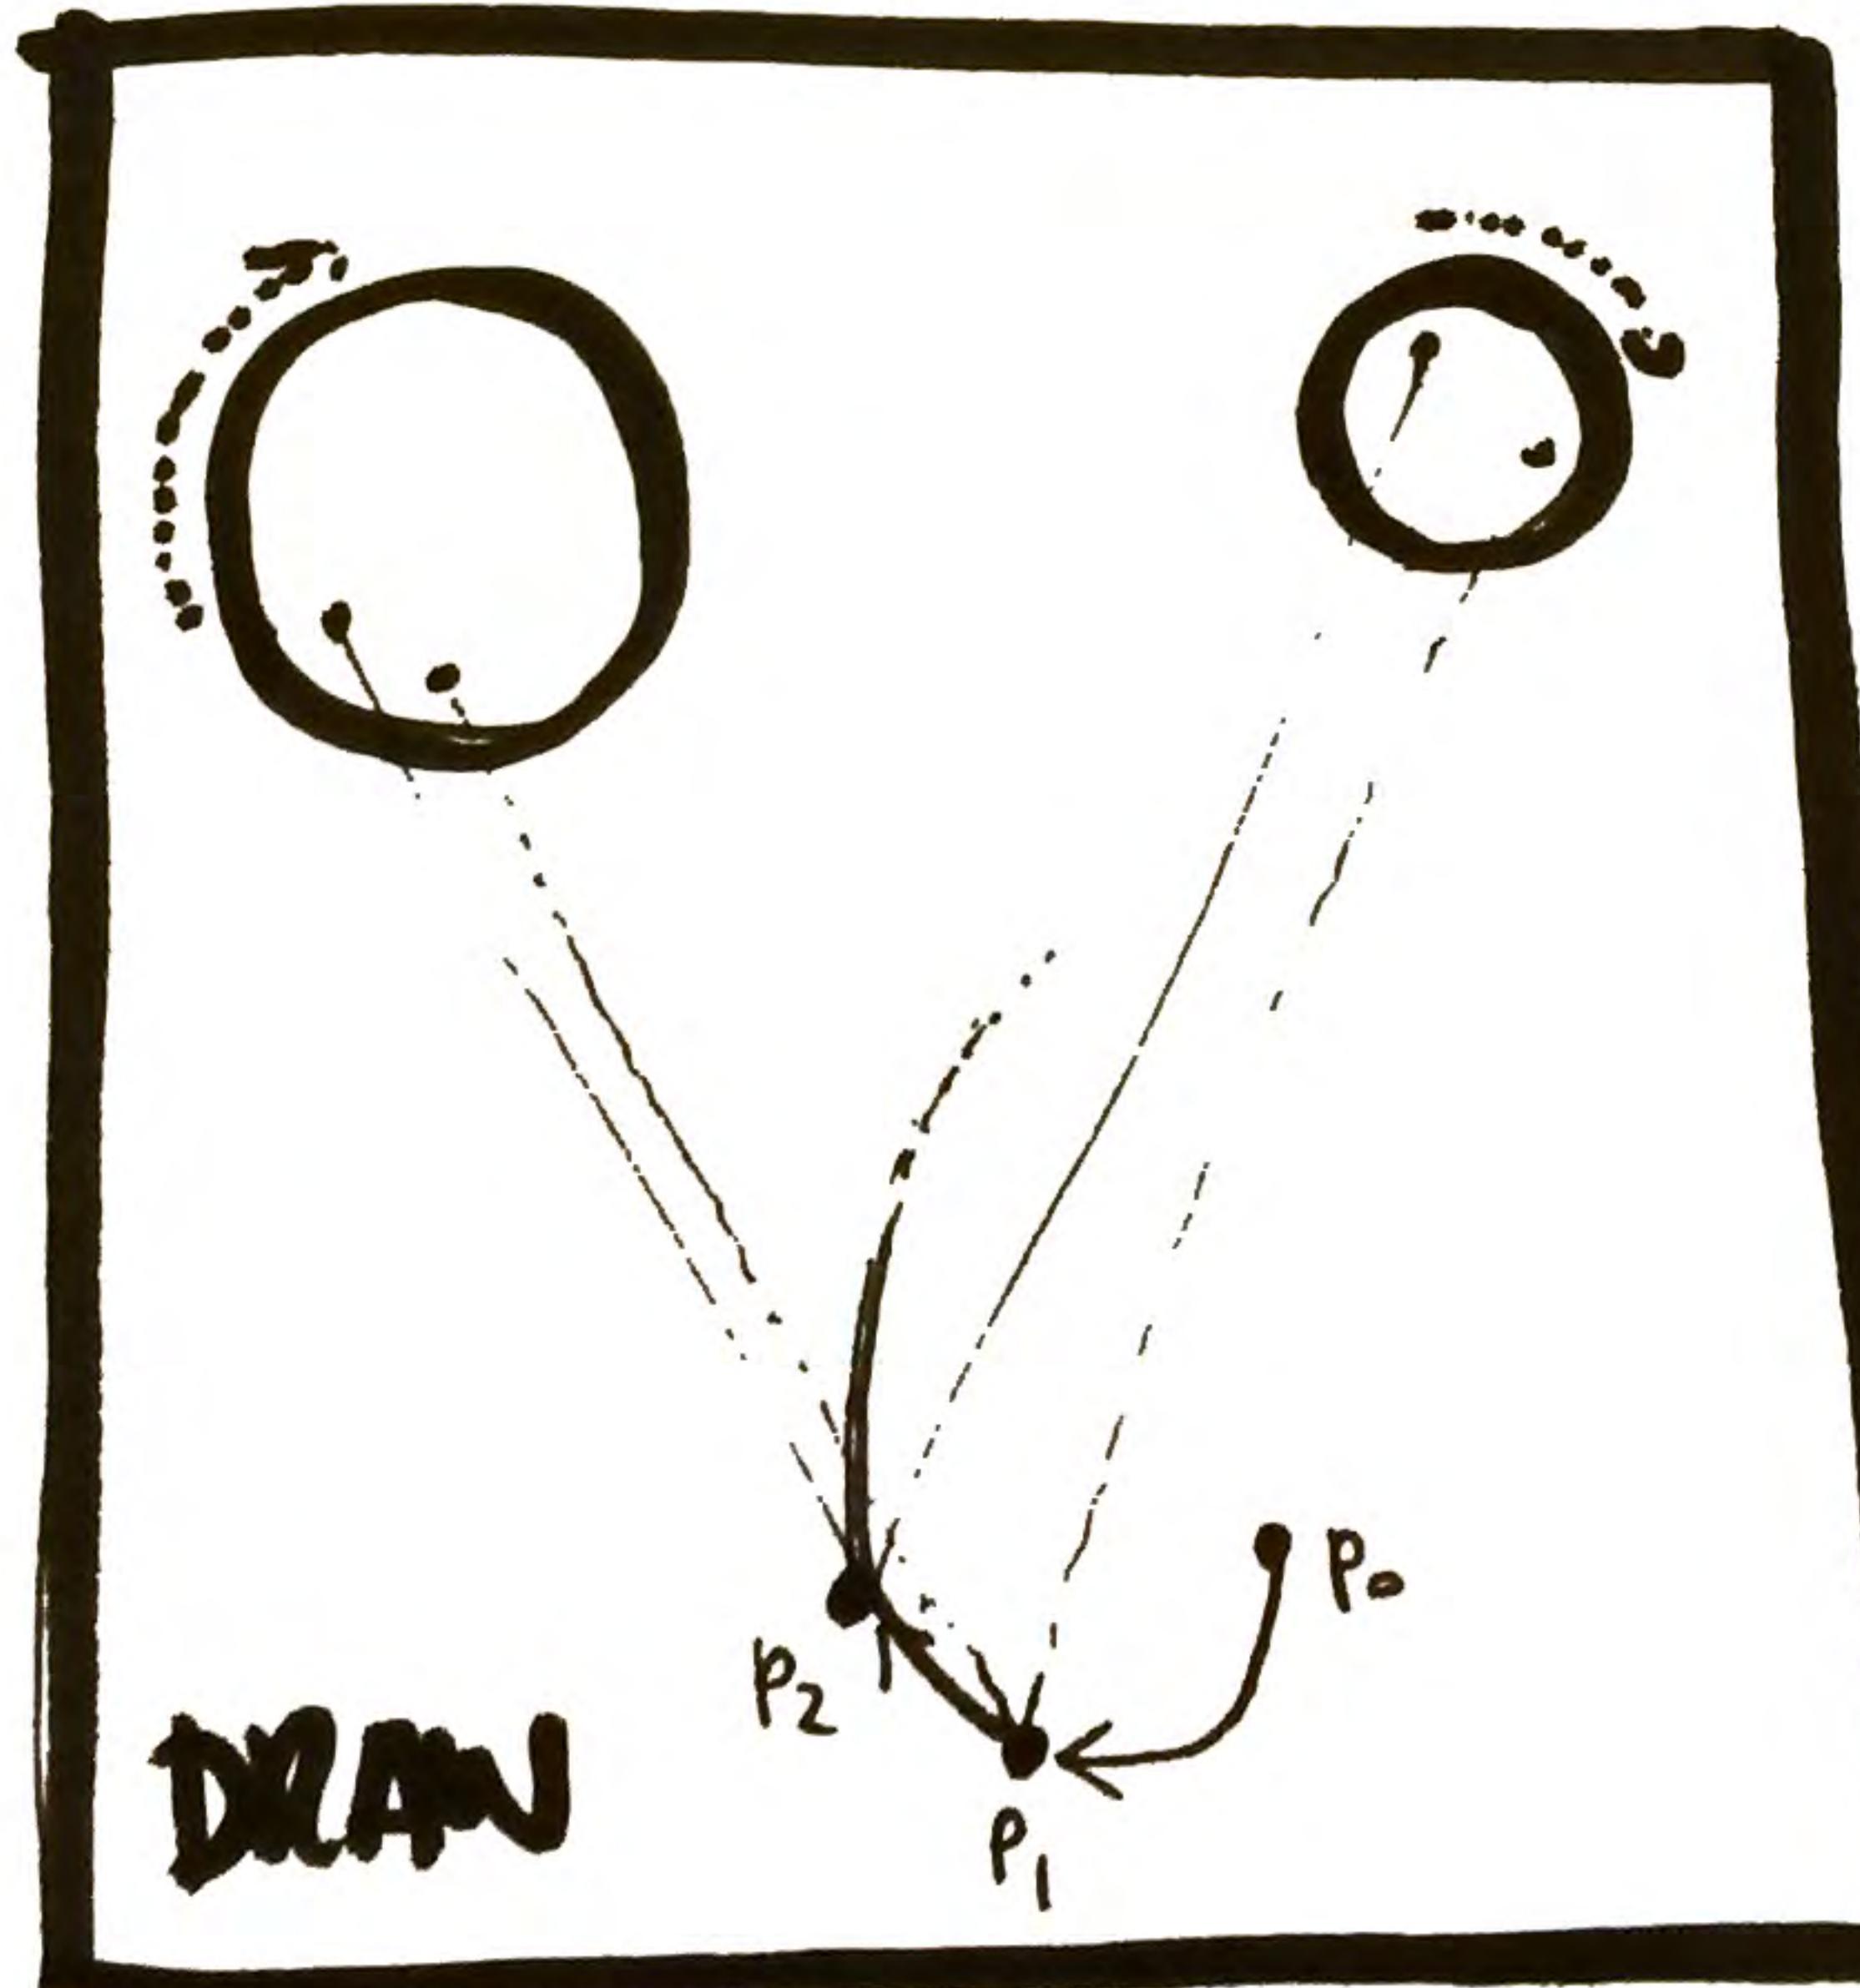

[2] PLACE THE GEARS ON THE CANVAS

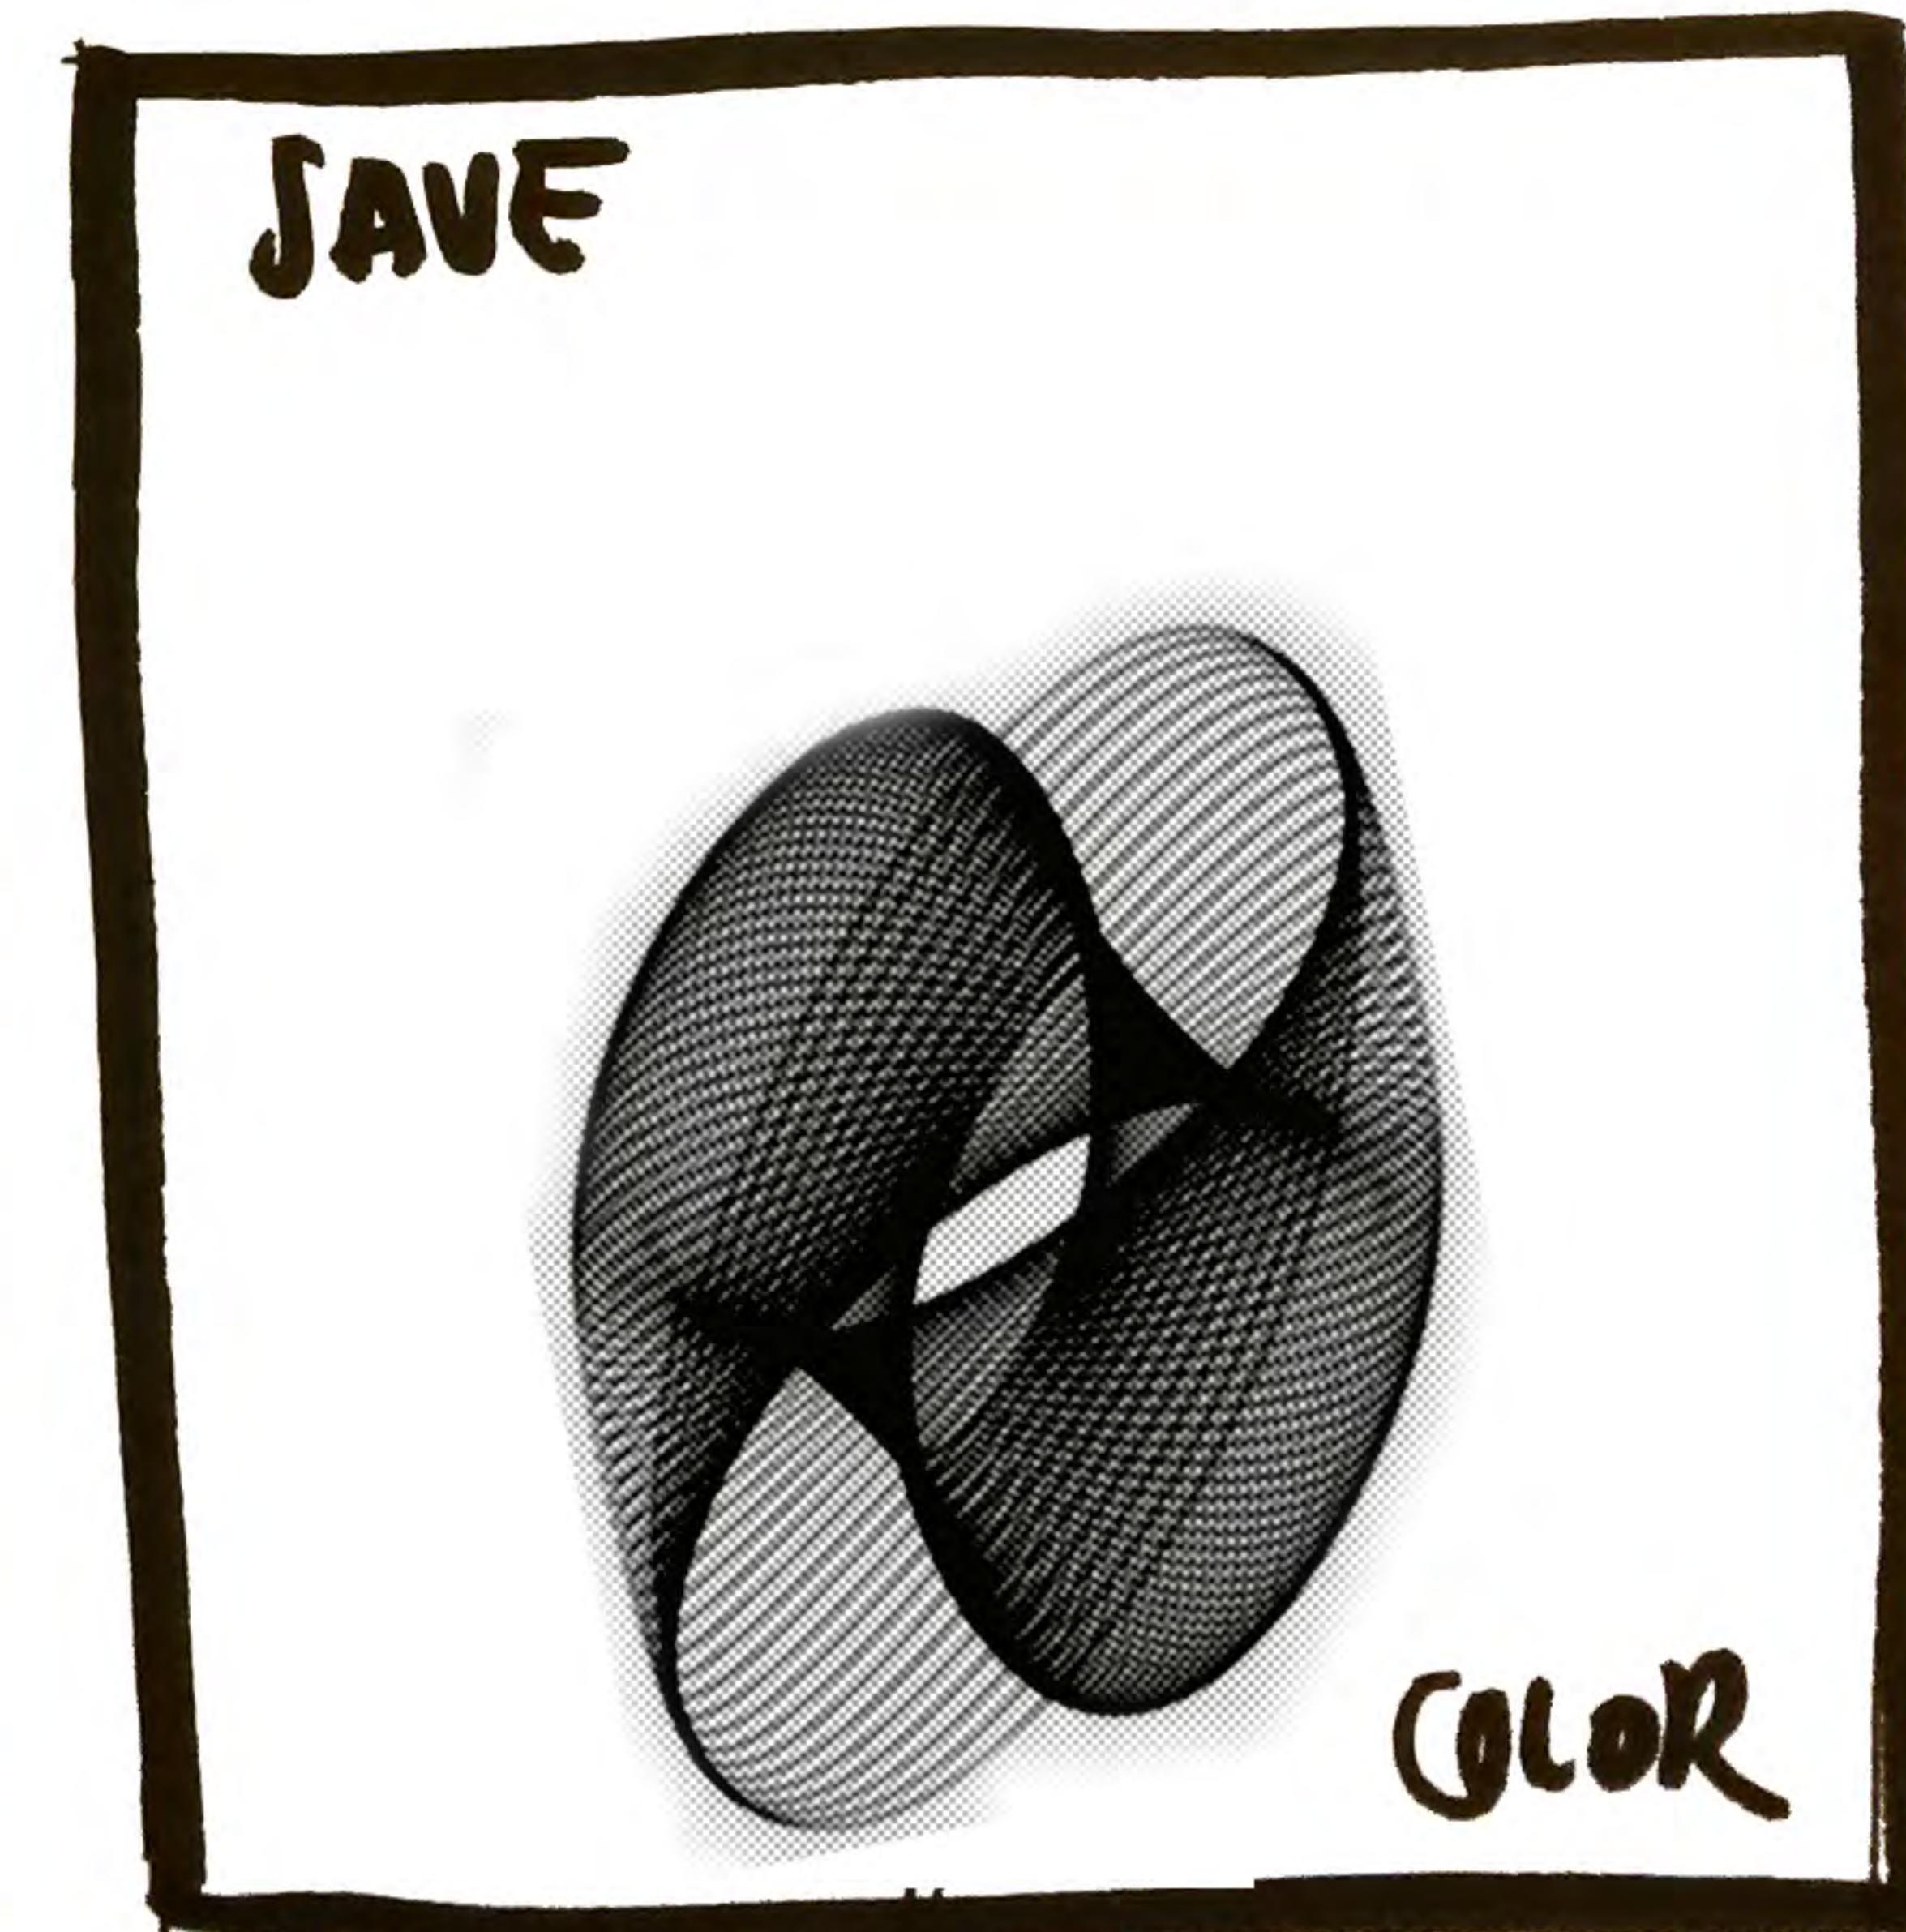

ANCHOR ARMS

[3] choose rotation speed,
choose the drawing arms

DRAW

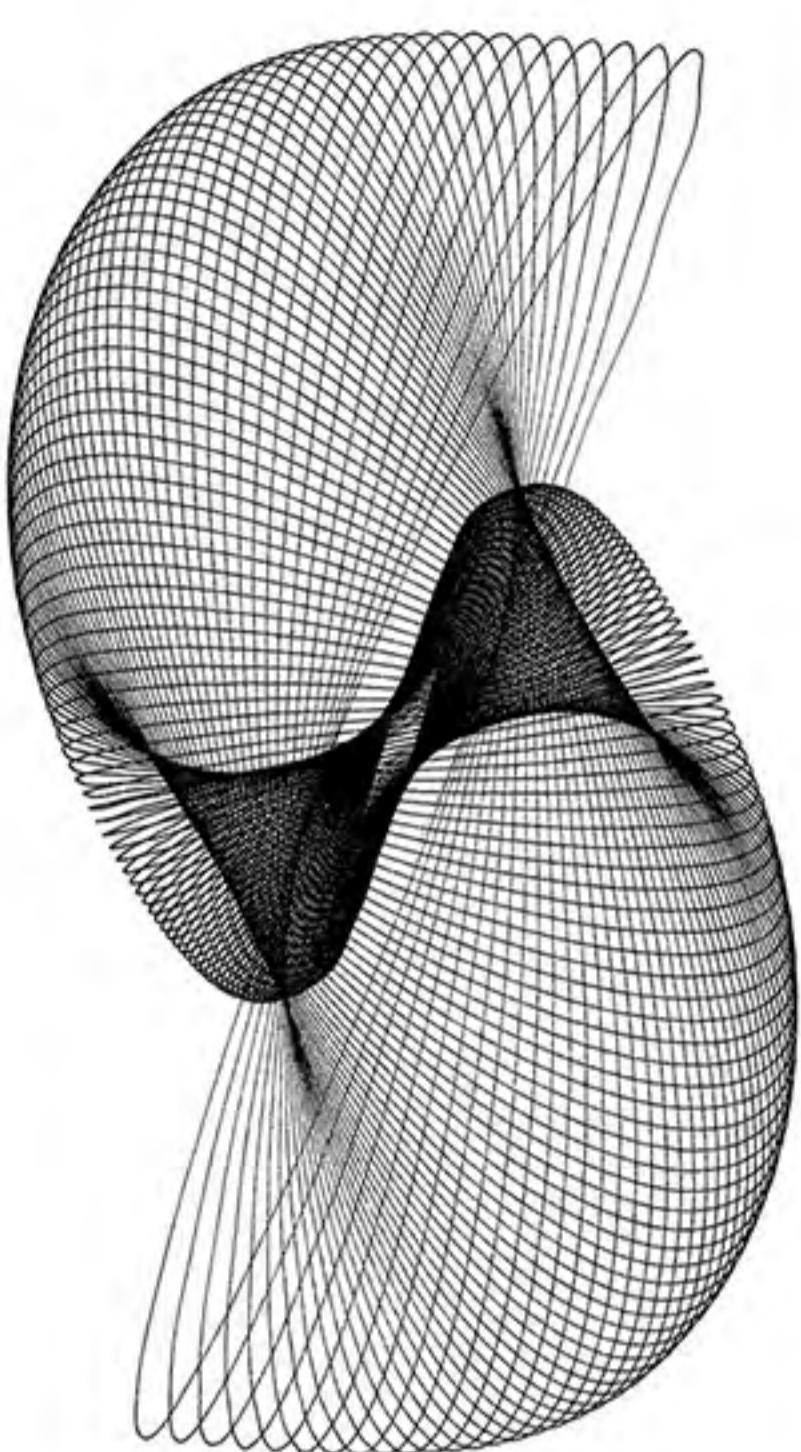

start draw of

[4] Speed up and
SEE THE RESULT

1 look at this cycloid

LOOK!

2 retrieve the gears position & dimensions

HOW WAS IT
MADE?

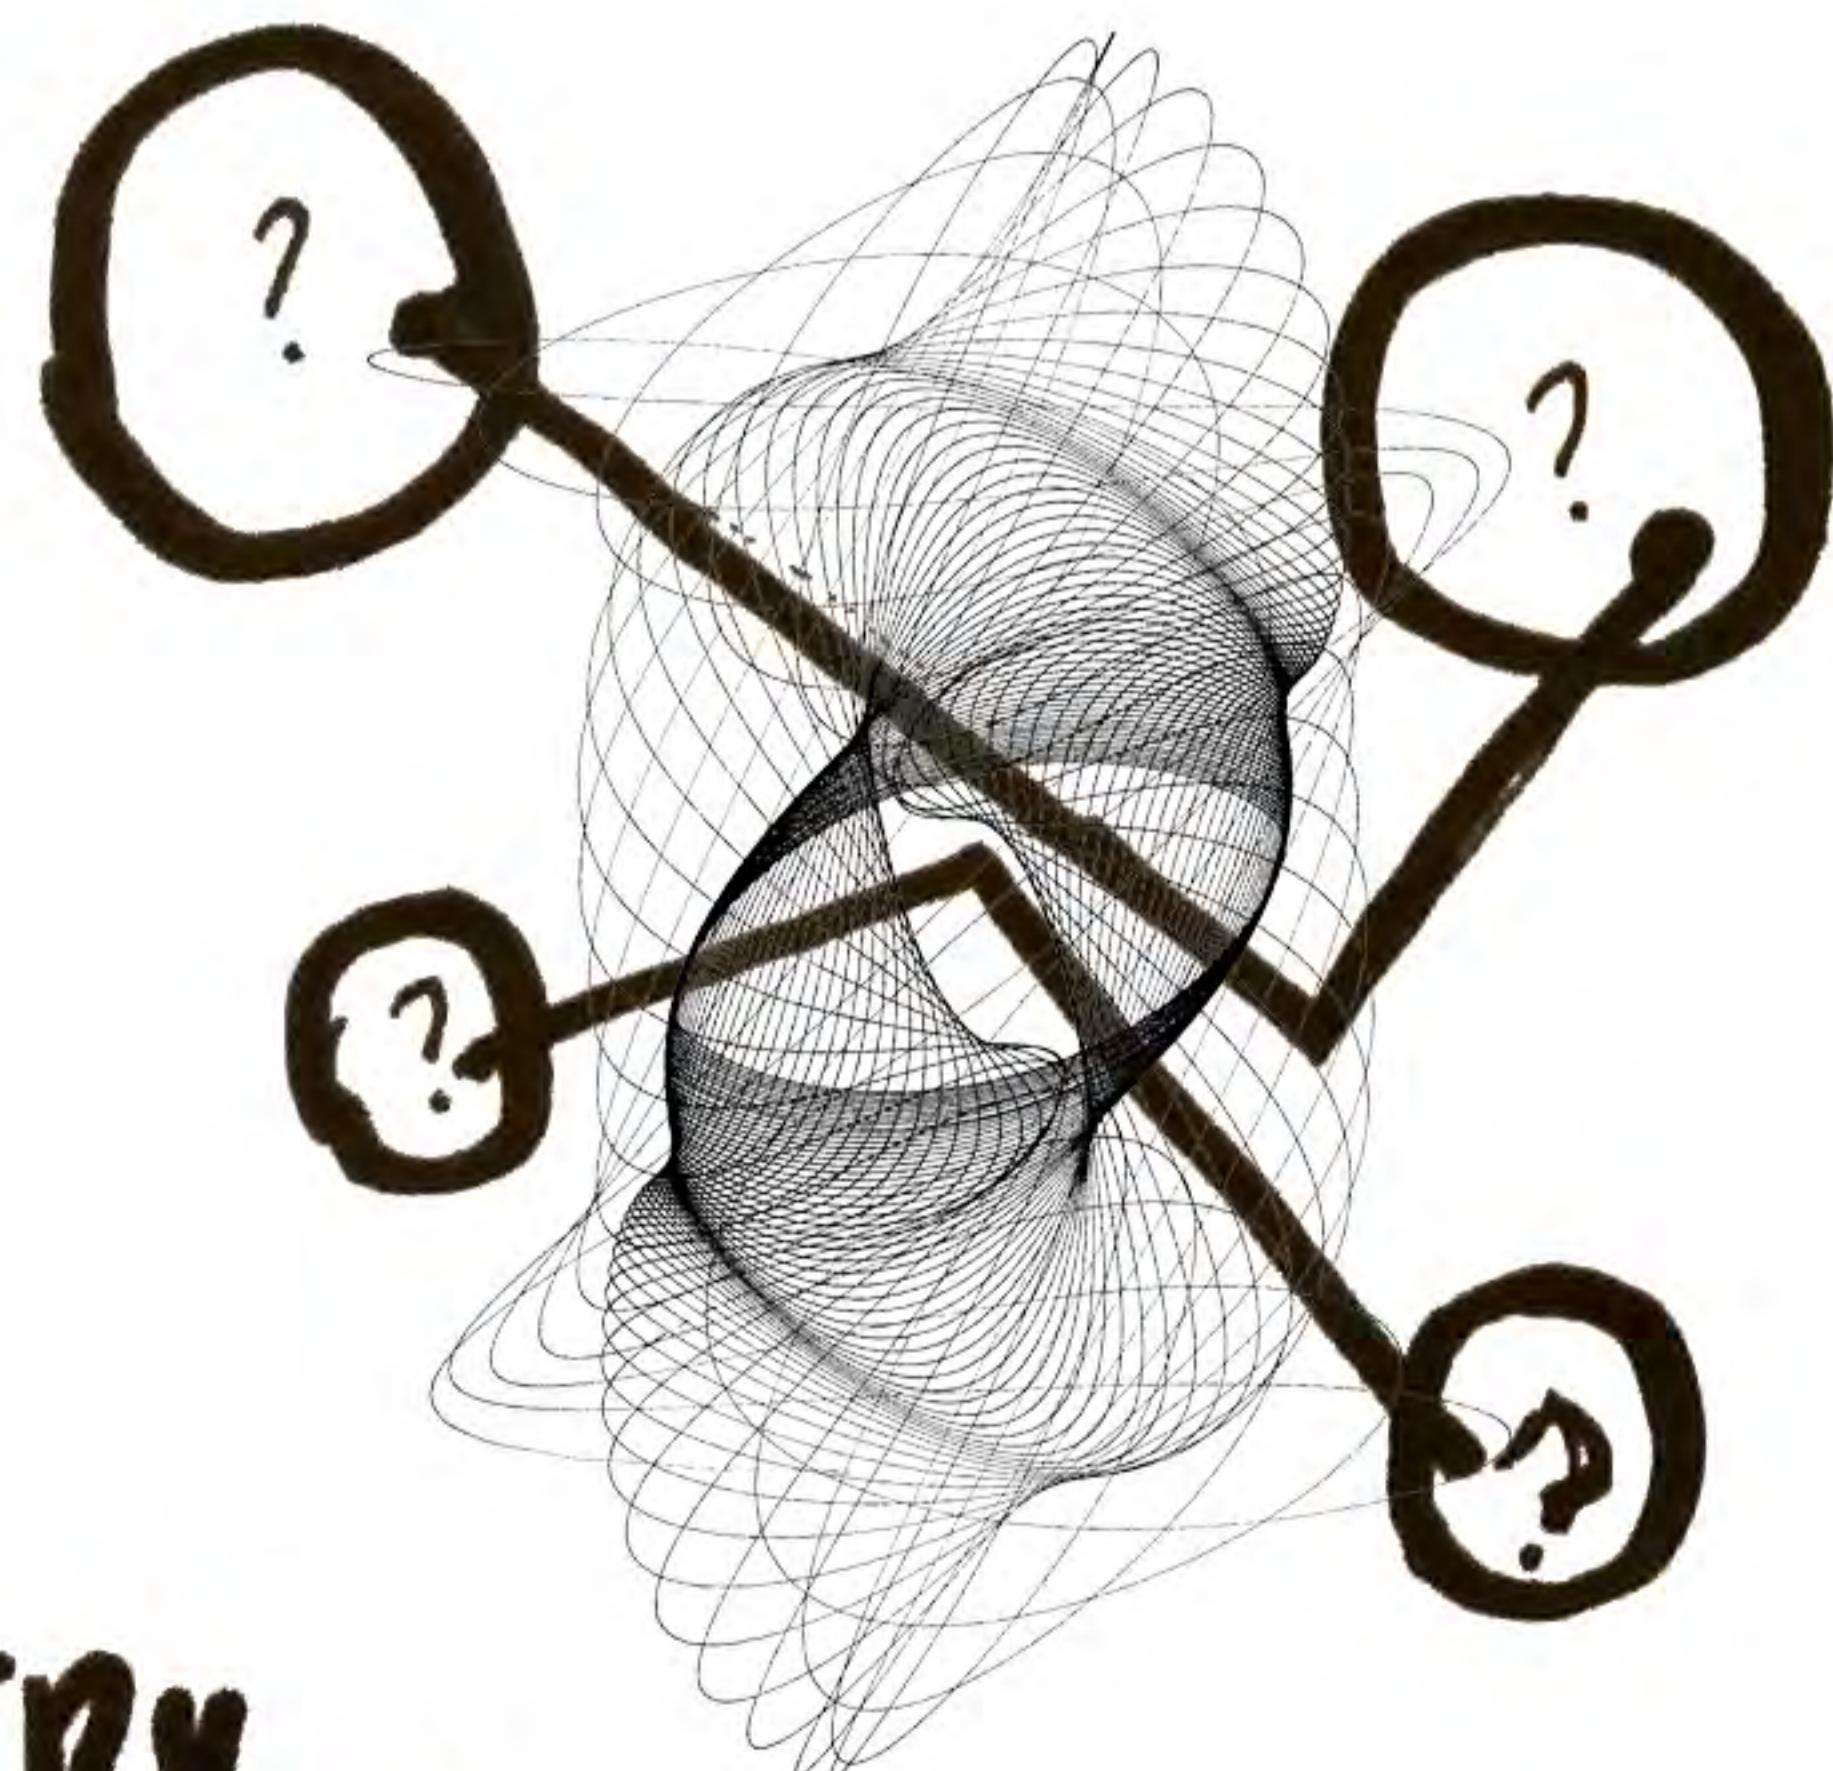

FEATURES

and display

- speed up the drawing process (or slow down)
→ use threshold properly
- gears visualization \langle ^{on} off
- visualize with brushes
- color the cycloid by clicking inside the white spaces
- let Python do the drawing rendering

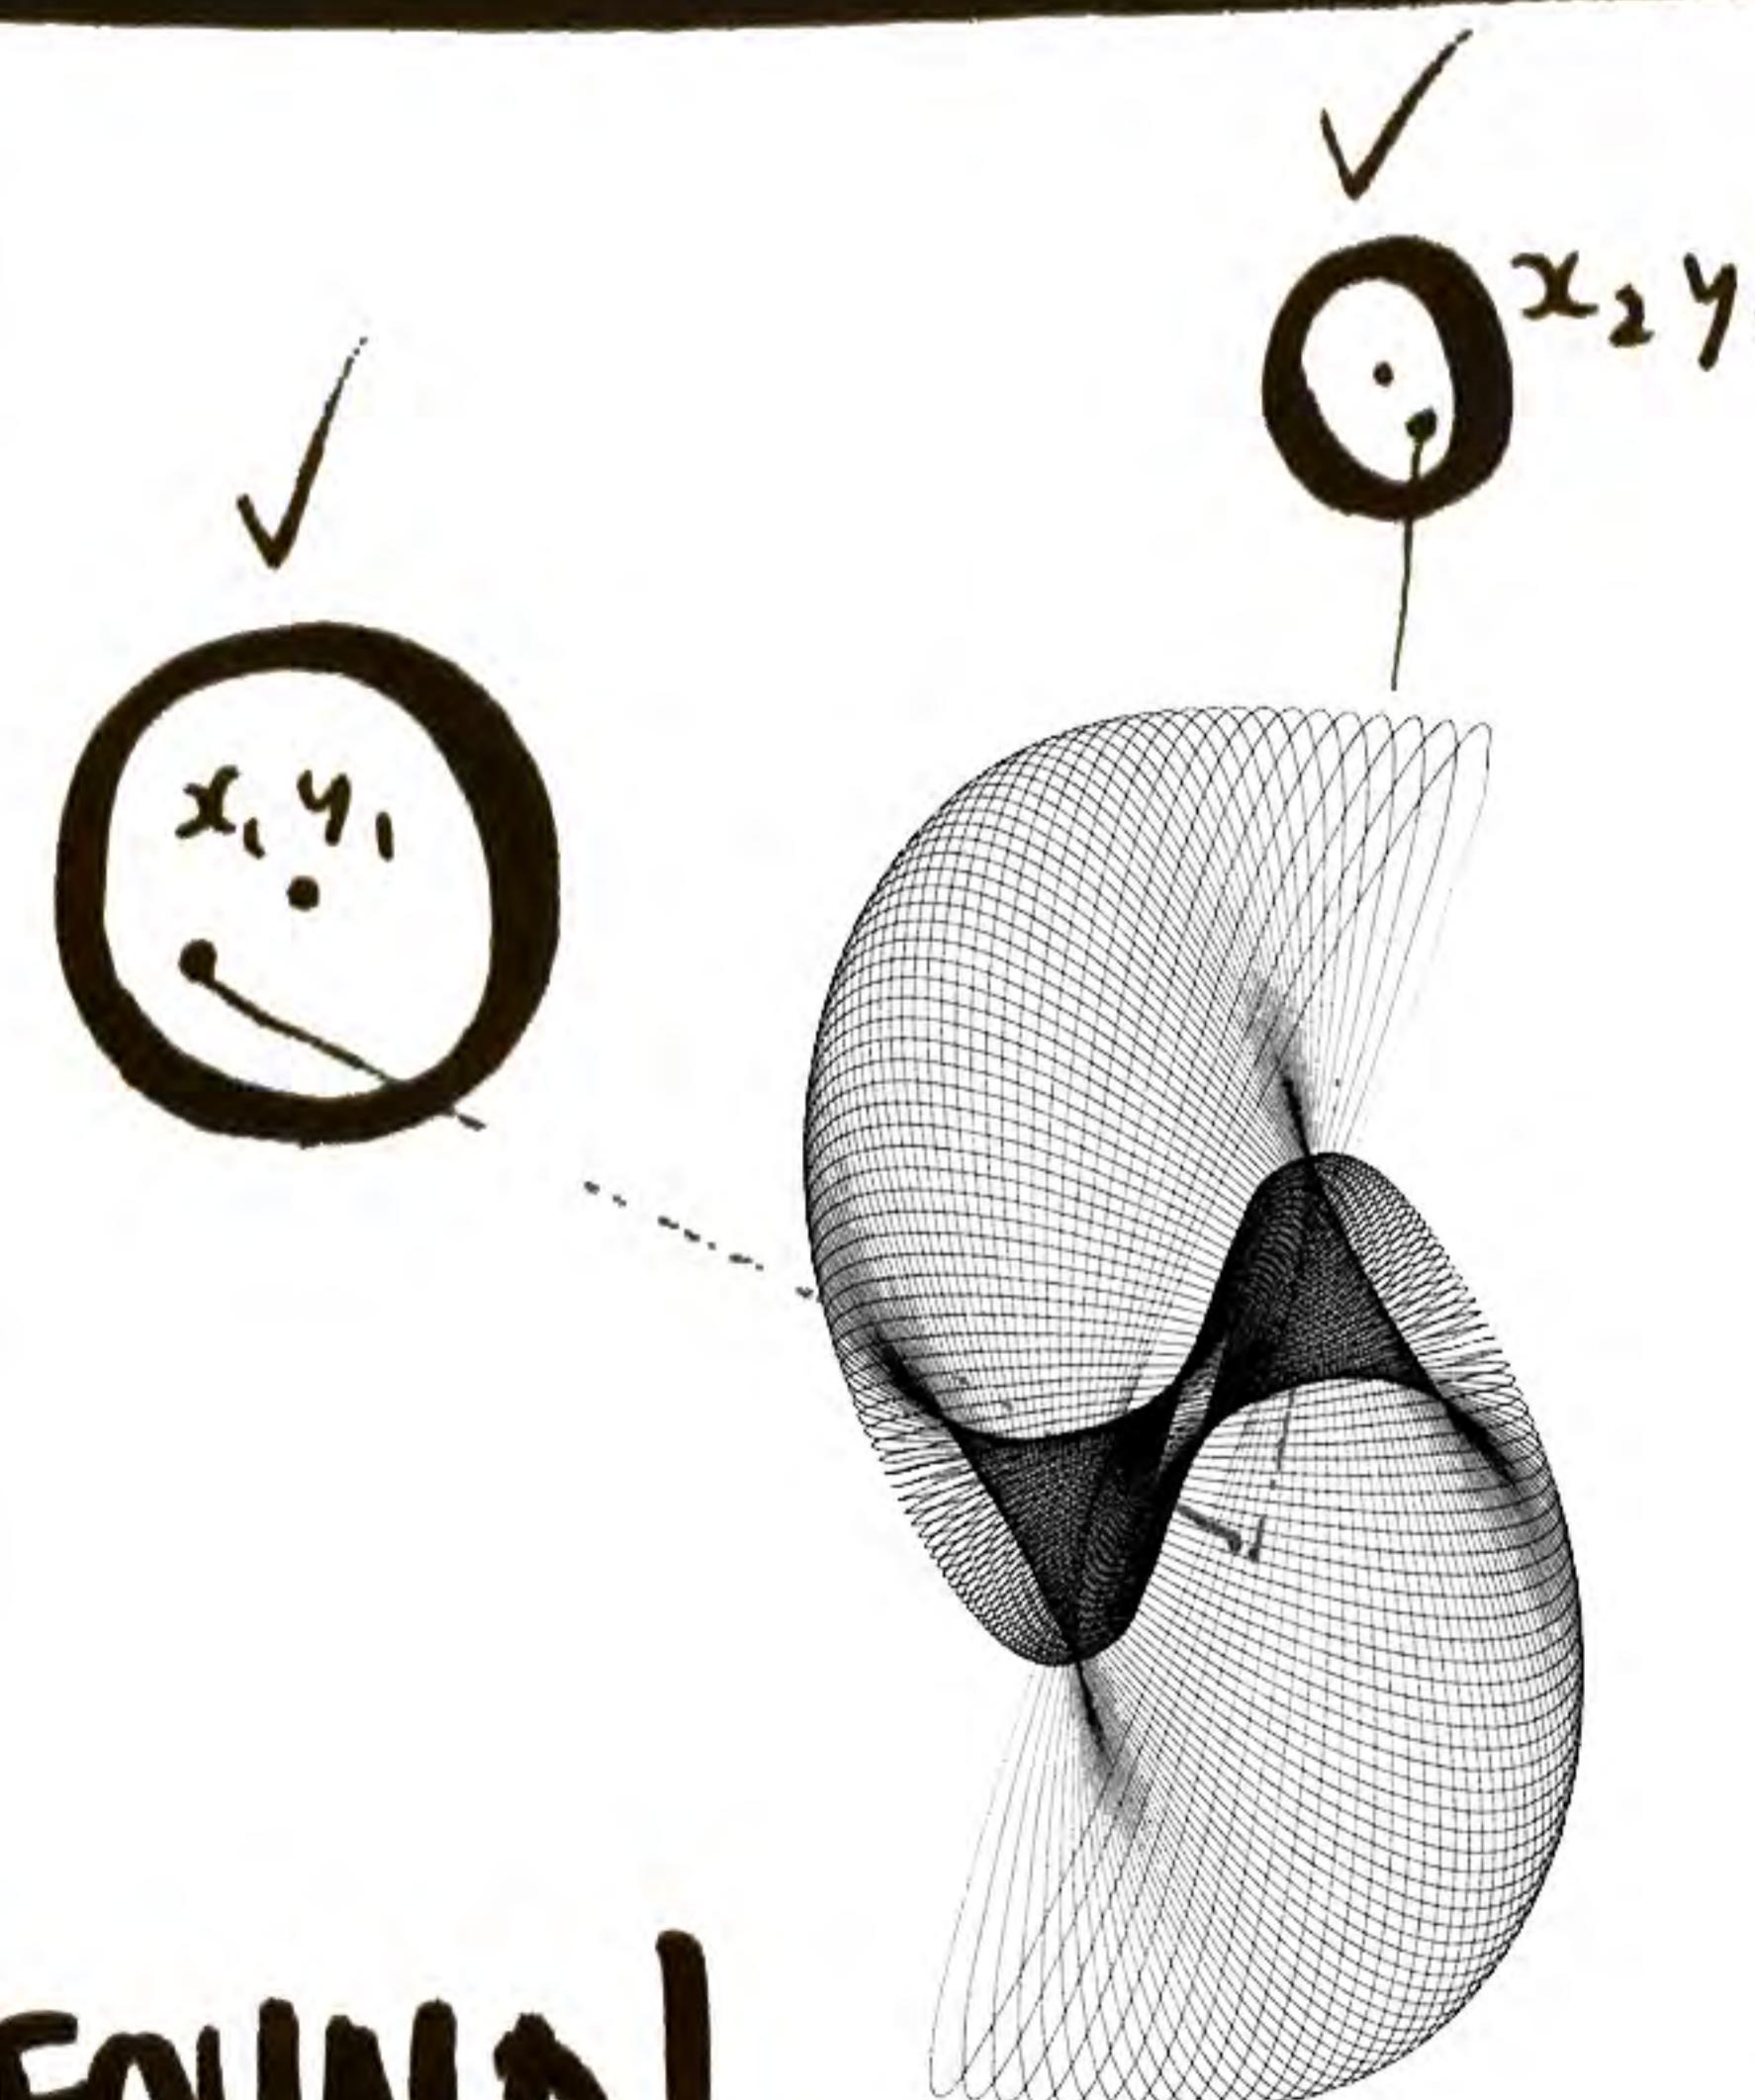

2 how was it made?

which gears? which radius?

TRY...

3 You Win!

FOUND!

MODE II LOOK AT THE DRAWING, RETRIEVE THE ORIGINAL MECHANISM

CHALLENGES :

- TRIGONOMETRY (HARD MATH TO RECREATE THE MECHANISM)
- GRAPHIC USER INTERFACE (simple but PRECISE!)
- EDUCATIONAL GOAL

EXTRA POSSIBLE FEATURES :

- COLOR THE CYCLOID ON TKINTER
- EXPORT TO DXF / DWG ...
- HISTORIC / MATH EXPLANATIONS
